

LUCKY SCRATCH

PLAYER & MECHANICS GUIDE

How the **game** works.

Everything behind the scratch —
matching, prizes, multipliers, ticket tiers,
and the odds that make it tick.

Match to win

✦ Multipliers

4 ticket tiers

Virtual coins

Lucky Scratch is an entertainment game. All coins are virtual — no real money, withdrawals, or real-world prizes.

THE IDEA

Scratch a card, match a lucky number, win the prize.

Every ticket is a grid of hidden numbers sitting under a scratch layer. A handful of **winning numbers** are printed at the top. Reveal a square whose number matches one of them and you win the prize on that square — bigger tiers and lucky ♦ **multiplier** squares push the wins higher. You play with virtual coins, level up as you go, and chase collector badges.

ANATOMY OF A TICKET

What you're looking at.

WINNING NUMBERS

20 40 33 60

? 12 40 ?

7 ? 58 3

? 21 ? 44

9 ? 33 ?

16 squares · 4 winning numbers. The gold square (40) matches a winning number and carries a ♦ multiplier — that's a win.

The winning numbers

Four numbers printed across the top. These are the targets — anything you reveal that equals one of them pays out.

Your 16 squares

A 4×4 grid you scratch open. Each square hides a number from 1–60 and a prize amount; some also hide a ♦ multiplier.

The ♦ multiplier

A lucky square that multiplies its prize (×2 up to ×100 on the top tier). Multipliers switch on once you reach **Level 3**.

HOW TO PLAY

Four moves per card.

1 Buy a ticket

Pick a tier and spend its coin cost. A fresh card is dealt with hidden numbers.

2 Scratch to reveal

Drag across the silver squares to uncover your numbers — reveal as many as you like.

3 Match & win

Any revealed number that appears in the winning numbers pays its prize — ♦ squares multiply it.

4 Check or reveal

Reveal at least **8** squares then tap **Check**, or **Reveal** to open the whole card and settle.

HOW YOU WIN

Every matched square pays.

Only squares that match a winning number are paid — the rest are just decoration. A matched square pays its own prize, and if it holds a ♦ multiplier, the prize is multiplied. Your total is the sum of every matched square.

PAYOUT PER MATCHED SQUARE

Prize × **Multiplier** = **Coins won**

Example — a matched square worth **500** with a **×10** multiplier pays **5,000 coins**. No multiplier? It simply pays its **500**.

THE LINE-UP

Four ticket tiers.

Pricier tiers cost more but carry bigger prize pools, higher top prizes, and more frequent ♦ multiplier squares. They unlock as you level up.

TICKET	PRICE	UNLOCKS	TOP PRIZE	PRIZE RANGE	♦ CHANCE
 100X Starter	500	Lv. 1	100×	50 – 1,500	6%
 Gem Rush	1,000	Lv. 4	250×	100 – 3,500	16%
 Neon Vault	2,500	Lv. 8	500×	250 – 10,000	20%
 2000X Crown	5,000	Lv. 15	2000×	500 – 25,000	24%

Prizes and costs are in coins. Crown tickets add a rare **×100** multiplier to the usual **×2 / ×5 / ×10**.

PROGRESSION

Leveling up.

Every **5 tickets** you scratch raises your level:

Level = **tickets scratched** ÷ **5** + **1**

New levels unlock pricier tiers, and ♦ **multipliers turn on at Level 3**. Scratch **50** tickets of one type to earn its golden collector badge.

ECONOMY

Coins & top-ups.

Starting balance	20,000 coins
Daily reward	Once per day
Daily Rescue (when low)	+1,500 coins
Real-world value	None — virtual only

Coins are for play only. The daily reward and the low-balance Rescue keep you topped up so you can always keep scratching.

The odds that shape a card.

When a ticket is dealt, the game first rolls **how many** of its 16 squares will match a winning number — 0, 1, 2, or 3:

On average a ticket matches **0.83** squares. Just over half of all cards win nothing — that's what keeps the big wins meaningful.

How each prize is chosen

Every square draws its prize **evenly** from that tier's prize pool — each value equally likely. So the pool's **average**, not its top prize, is what really drives payouts.

When multipliers apply

Once you're Level 3+, each square rolls the tier's **♦ chance** to carry a multiplier; if it does, the multiplier is drawn evenly from that tier's set. A multiplier only pays on a square that also matches.

Return rate (RTP)

Behind the scenes the game balances $\text{expected matches} \times \text{average prize} \times \text{average multiplier}$ against the ticket price to keep the coin economy healthy.

About this guide. Lucky Scratch is an entertainment game that uses virtual coins only — there is no real money, no withdrawals, and no real-world prizes, and it is not gambling. Numbers shown (prizes, odds, tiers) reflect the game's default configuration and can be tuned by the operator; your in-game values may differ. Winning numbers and squares in the diagram are illustrative.
